## PROFESSIONAL EXPERIENCE

---

### Fanatics

#### Software Engineer II

**Boulder, CO, USA**

*June 2023 - Present*

- Achieved a critical team OKR of migrating 30+ existing applications from EC2 to Kubernetes by spearheading the creation and design of tools and pipelines that facilitated app teams to configure and deploy their services onto the Kubernetes platform. Prioritized user experience with additional focus on ease of use and stability
- Developed Python workflows running on GitHub Actions allowing teams to deploy, terminate, scale, and rollback deployments. Enabled canary deployments with traffic shifting and manual progression controls. Used Helm, ArgoCD, and Argo Rollouts
- Onboarded 50+ internal applications and microservices running in production. Currently totaling ~600 deployments across 7 separate K8s clusters on AWS EKS
- Improved developer velocity and reduced configuration complexity and errors by creating and maintaining a reusable Helm template to generate and configure common K8s resources from a simplified YAML app manifest
- Developed a Golang CLI tool that integrated with existing servers to enable developers to trigger their deployments
- Created abstract syntax trees in Golang to translate existing JSON application manifests into Helm chart YAML configs
- Continuously updated CI pipelines to run new unit tests and release new versions of Docker images and binaries

### Fanatics

#### Software Engineer I

**Boulder, CO, USA**

*June 2022 - June 2023*

- Developed a POC in Golang for disaster recovery workflows using Temporal. Automated creation of networking infrastructure and foundational services based on a config file. Reduced a week-long manual process to a few hours.
- Developed a Python package abstracting AWS SSM, and designed a workflow capable of persistent patching of hundreds of EC2 servers across multiple accounts. Used to update Consul agent to the newest version without requiring application restarts across hundreds of running applications across 9 accounts
- Created reliable deployment workflows for foundational services onto AWS, automating previous manual processes, reducing human error and decreasing deployment time while including health checks and alerts. Developed a Python package for reusable functionality, utilizing boto3 to interact with AWS

### Fanatics

#### Technology Intern

**Boulder, CO, USA**

*June 2021 - June 2022*

- Provided real-time alerting for outages of foundational services (Vault, Consul, PDNS, Proxies) to support stability during platform changes by developing a Python Flask backend service to perform recurring synthetic tests
- Reduced incoming inquiries by developing a centralized frontend homepage with React to display aggregate health statuses over multiple health checks for 5 different services across 9 different AWS accounts. Supported toggling of maintenance windows and filtering by accounts

## EDUCATION

---

### University of Colorado - Boulder

*Bachelor's, Computer Science*

**August 2018 - May 2022**

*GPA: 3.9*

## PROJECTS

---

### Pathfinder (Search Visualizer)

*January 2026 - Present*

- A C++ search visualizer using SDL3 that lets users build grids and watch algorithms determine the path in real time

### MCP Server

*December 2025 - Present*

- Creating a MCP server and golang package that interacts with a anime/manga database
- Users can now query their LLMs to get rankings and details on shows with natural language.

### Sonistocks (Stock Sonification and Visualization)

*January 2026 - Present*

- Python application that turns data for specific tickers from the stock market into a graphical animation with music derived from stock performance

## SKILLS

---

**Skills:** Python, Go, AWS, Kubernetes, Flask, Docker, Terraform, Agile, Git
